

Jumping Spider

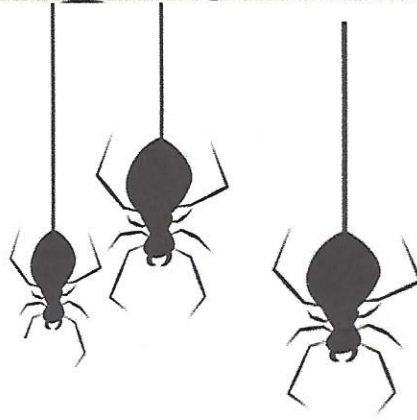

Spiders

Nursery Web Spider

Facts

- They have the best vision of all spiders the best time though is in sunlight
- They get their name because of their ability to jump
- Only live for about a year
- There Colors can vary usually u will see there black but some can be brown, tan or grey with pale markings
- They will bite in defense but their bites are not poisonous (still always clean an disinfect any bite)
- It's very rare for them to bite person because there more afraid of us.
- They mainly hide outdoors but you can find them in your house mostly near doors and windows due to that's where the small insects can come in
- They don't construct snare webs but will build a web retreat (loosely woven, saclike composed with several openings)
- The retreats are used for hibernation; nighttime seclusion and laying their eggs (they usually build one for each activity)

Facts

- Its one of the largest true spiders so big sometimes there mistaking as a tarantula
- Females will carry the eggs in a sac that she holds with her fangs until there just about ready to hatch, each sac can hold a few hundred
- When eggs are ready to hatch the female build a protective nursery web witch, she will guard over till they have all hatched and will shelter till they can fend for themselves (you can find these webs in high weeds or low shrubs)
- The common place for these spiders is woodlands, Gardens, Grasslands an old field.
- they mature in late spring and reproduce in summer so you will see them often around may till end of July
- They won't spin a web to catch there pray they actually like to hunt there pray
- They are not aggressive towards humans but a female will guard her egg sac ferociously so if tampered with it could result into a bite which could be painful however their bites are considered not dangerous so still clean the bite as a precaution

Spiders

Wolf Spider

Facts

Facts

- There webs are usually Built in or beneath objects close to the ground.
- Common places for these webs are under porches, under foundations of buildings and Basements.
- They mostly eat small insects but sometimes if caught in their webs they will eat mice, snacks and lizards.
- There venom is what subdues the pray
- A female will lay their eggs in a brown papery sac that can hold between 25 to 900 or even more eggs at a time.
- Bites from a female or adult female widow is potentially dangerous due to the toxin they can inject in to us causing the affects on are nervous systems. Muscle and chest pains or even tightness is some of the most common reactions from the toxin
- People that are very young or elderly or those who have history of high blood pressure are at greatest risk. Prompt medical treatment can reduce the danger of the bite

- There one of the largest spider family
- There pretty difficult to spot an or even catch
- Male spiders rarely last a year but the female can last several years
- Once a female has mated, she will lay her eggs in a round ball made from her silk of web she will leave the sac in a tunnel at night but bring it to surface during the day for the warmth
- Most live on the ground so they can use their eyesight and quick speed to capture their prey
- A bite can be quite painful and you should seek medical attention
- They eat small insects but some larger wolf spiders will pray on small vertebrates
- They also rather hunt their food at night sense their rather fast and can climb or swim while there hunting even though their ground dwellers
